## Features

- Axial piston pump A10VO, variable, in swashplate design for hydrostatic transmissions in open loop circuit
- Flow is proportional to drive speed and displacement. By adjusting the swashplate angle it is possible to infinitely vary the flow
- Mounting flange acc. to SAE J744
- Flanged ports acc. to SAE J518
- 2 case drain ports
- Good suction characteristics
- Permissible working pressure 4000 psi (280 bar)
- Low noise level
- Long service life
- Axial and radial loading of drive shaft possible
- High power-weight ratio
- Wide range of controls
- Short response times
- Through drive option for multi-circuit system

# Technical data

## Fluid

Prior to project design, please see our data sheets RA 90220 (mineral oil) and RA 90221 (ecologically acceptable fluids) for detailed information on fluids and application conditions. When using ecologically acceptable fluids attention must be paid to possible limitations of the technical data. If necessary please contact us.

### Operating viscosity range

For optimum efficiency and service life we recommend that the operating viscosity (at operating temperature) be selected in the range

$$\nu_{\text{opt}} = \text{opt. operating viscosity } 80 \dots 170 \text{ SUS (} 16 \dots 36 \text{ mm}^2/\text{s})$$

referred to tank temperature (open loop circuit).

### Limits of viscosity range

The following limits are valid for extreme operating conditions:

$$\begin{aligned} \nu_{\text{min}} &= 60 \text{ SUS (} 10 \text{ mm}^2/\text{s}) \\ &\text{short term (} t \leq 1 \text{ min)} \\ &\text{at a max. permissible oil temperature} \\ &\text{of } t_{\text{max}} = 239^\circ \text{F (} 115^\circ \text{C).} \end{aligned}$$

Please note, that the max. fluid temperature of 239 °F (115 °C) is also not exceeded in certain areas (for instance bearing area). The temperature in the bearing area is approx. 7 °F (5 K) higher than average leakage fluid temperature.

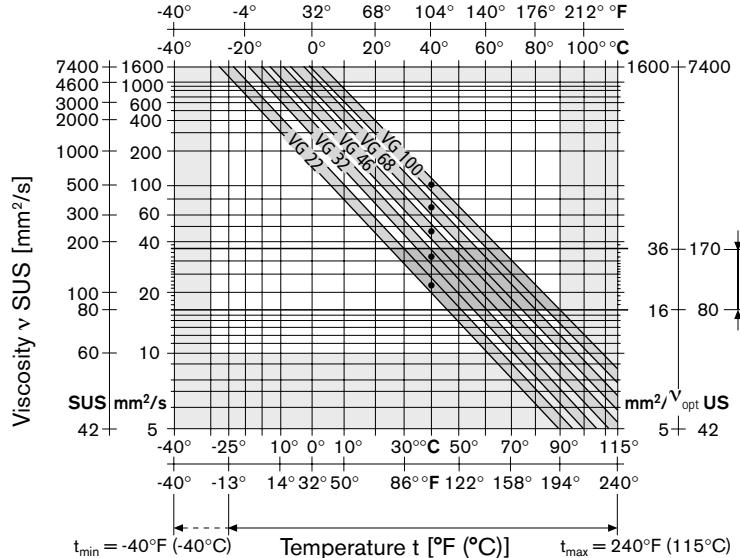

$$\begin{aligned} \nu_{\text{max}} &= 7500 \text{ SUS (} 1600 \text{ mm}^2/\text{s)} \\ &\text{short term (} t \leq 1 \text{ min)} \\ &\text{on cold start} \\ &(t_{\text{min}} = p \leq 436 \text{ psi/30 bar, } n \leq 1000 \text{ rpm, } -40^\circ \text{F/40 }^\circ \text{C.)} \end{aligned}$$

At temperatures between -13 °F (-25 °C) and -40 °F (-40 °C) special measures may be required for certain installation positions. Please contact us for further information.

For detailed information on operation at very low temperatures see RA 90300-03-B.

When operating at temperatures between 195 °F (+90 °C) and 239 °F (115 °C) use FKM-seals (code designation V).

### Selection diagram

### Notes on the selection of hydraulic fluid

In order to select the correct fluid, it is necessary to know the operating temperature in the tank (open circuit) in relation to the ambient temperature.

The hydraulic fluid should be selected so that within the operating temperature range, the viscosity is within the optimum range ( $\nu_{\text{opt}}$ ); see shaded section of the selection diagram. We recommend that the higher viscosity grade is selected in each case.

Example: at an ambient temperature of  $X$  °F (°C) the operating temperature in the tank is 140 °F (60 °C). In the optimum viscosity range  $\nu_{\text{opt}}$  (shaded area), this corresponds to viscosity grades VG 46 or VG 68, VG 68 should be selected.

**Important:** The leakage oil temperature is influenced by pressure and speed and is typically higher than the tank temperature. However max. temperature at any point in the system may not exceed 239 °F (115 °C).

At high temperatures please use FKM seals.

If the above mentioned conditions cannot be kept due to extreme operating parameters or high ambient temperatures, please consult us.

### Filtration of fluid

The finer the filtration, the better the achieved cleanliness of the fluid and the longer the life of the axial piston unit.

To ensure a reliable functioning of the axial piston unit, a minimum cleanliness of

20/18/15 acc. to ISO 4406<sup>1)</sup> is necessary.

At very high fluid temperatures (195 °F (90 °C) up to max. 239 °F (115 °C)) the minimum cleanliness has to be at least

19/17/14 acc. to ISO 4406<sup>1)</sup>.

If the above cleanliness classes cannot be met please consult us.

<sup>1)</sup> draft issue 1999

## Technical data (valid for mineral oil; for ecologically acceptable fluids see RA 90221)

### Operating pressure range

#### Inlet

Absolute pressure at port S

$p_{abs\ min}$	12 psi (0,8 bar)
$p_{abs\ max}$	435 psi (30 bar)

#### Outlet

Pressure at port B

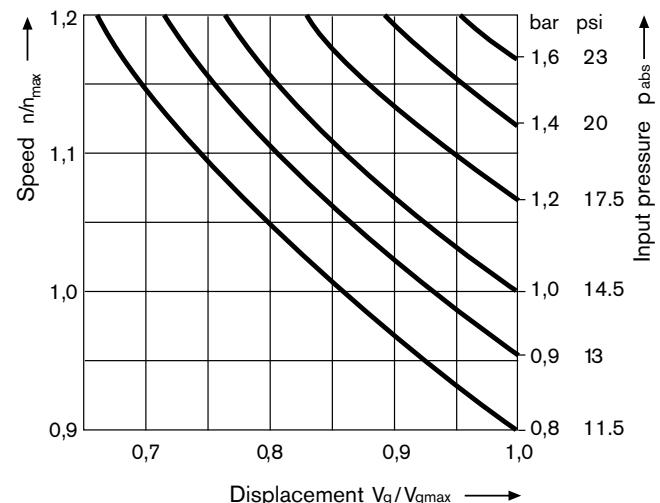

Nominal pressure $p_N$	4000 psi (280 bar)
------------------------	--------------------

Peak pressure $p_{max}$	5100 psi (350 bar)
-------------------------	--------------------

(Pressure data to DIN 24312)

Applications with intermittent operating pressures of up to 4600 psi (315 bar) at 10 % duty cycle are permissible.

Determination of inlet pressure  $p_{abs}$  at inlet port S, or reduction in displacement for increasing speed.

### Case drain pressure

Maximum pressure of leakage fluid (at ports L,  $L_1$ ):

maximum 7 psi (0,5 bar) higher than inlet pressure at port S.

$p_{L\ abs\ max}$	29 psi (2 bar)
-------------------	----------------

### Direction of flow

S to B.

### High speed version

The sizes 45, 71, 100 and 140 are available in a High-Speed-version.

Without any changes in dimensions, these optimized units are suitable for higher input speeds, see table on page 6.

**Important:** The drive speed increase ( $1.2 \cdot n_0$ ) refers to the standard drive speed  $n_0$ .

e.g. size 100:  $n_{max} = 1.2 \cdot 2000 \text{ rpm} = 2400 \text{ rpm}$

**WRONG:**  $1.2 \cdot 2400 \text{ rpm} = 2880 \text{ rpm}$

### Mechanical displacement limiter

On size 18 a mechanical max. displacement limiter is standard on the non-through drive model N00, but not possible for the model with through drive.

$V_{g\ max}$ : for sizes 18  
Setting range from 50 % to  $V_{g\ max}$  stepless

**Table of values** (theoretical values, without considering  $\eta_{mh}$  and  $\eta_v$ ; values rounded)

<sup>1)</sup> Values shown are valid for an absolute pressure of 14.5 psi (1 bar) at inlet port S. At reduced displacement or increased inlet pressure the speed may be increased according to the diagram.

<sup>2)</sup> For higher radial loads, please consult us.

## Determination of size

$$\text{Flow } q_v = \frac{V_g \cdot n \cdot \eta_v}{231} \quad [\text{gpm}] \quad \left( q_v = \frac{V_g \cdot n \cdot \eta_v}{1000} \quad [\text{L/min}] \right)$$

$$\text{Torque } T = \frac{V_g \cdot \Delta p}{24 \cdot \pi \cdot \eta_{mh}} \quad [\text{lb-ft}] \quad \left( T = \frac{V_g \cdot \Delta p}{20 \cdot \pi \cdot \eta_{mh}} \quad [\text{Nm}] \right)$$

$$\text{Power } P = \frac{q_v \cdot \Delta p}{1714 \cdot \eta_t} \quad [\text{HP}] \quad \left( P = \frac{q_v \cdot \Delta p}{600 \cdot \eta_t} \quad [\text{kW}] \right)$$

$V_g$  = Geometrical displacement per revolution in  $\text{in}^3$  ( $\text{cm}^3$ )

$\Delta p$  = Pressure differential in psi (bar)

$n$  = Speed in rpm ( $\text{min}^{-1}$ )

$\eta_v$  = Volumetric efficiency

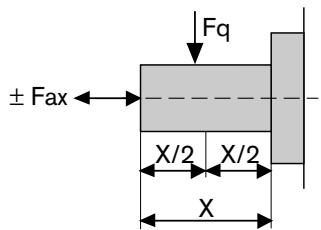

$\eta_{mh}$  = Mechanical-hydraulic efficiency

$\eta_t$  = Total efficiency

Volumetric efficiency

$$\eta_v = \frac{q_v}{q_{v\ theor.}}$$

## DG - two point, direct control

The pump can be set to a minimum swivel angle by connecting an external switching pressure to port X.

This will supply the control piston directly with control oil; a minimum pressure of  $p_{st} \geq 725$  psi (50 bar) is required.

The pump can only be switched between  $V_{g \max}$  or  $V_{g \min}$ .

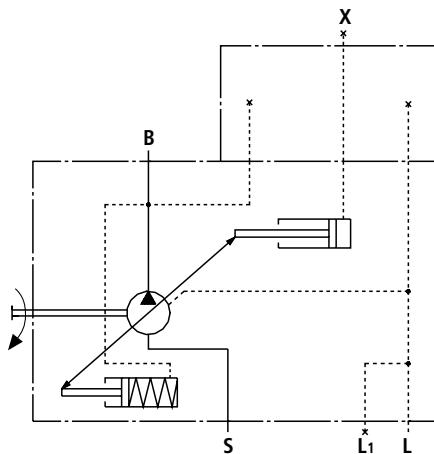

Please note, that the required switching pressure at port X is directly dependent on the actual operating pressure  $p_B$  in port B. (See switching pressure diagram)

Control pressure  $p_{st}$  in X = 0 psi (bar)  $\triangleq V_{g \max}$

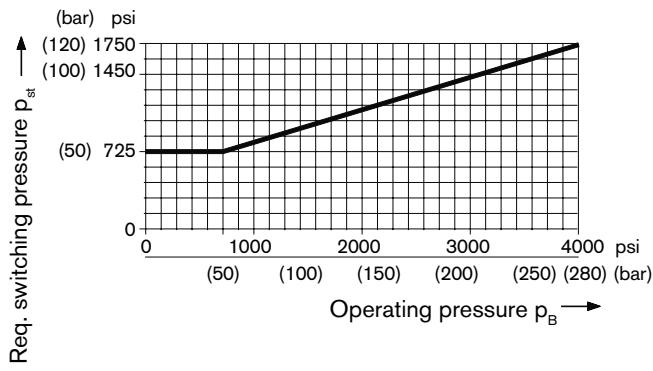

Control pressure  $p_{st}$  in X  $\geq 725$  psi (50 bar)  $\triangleq V_{g \min}$

The max. permissible switching pressure  $p_{st}$  is 4000 psi (280 bar).

# DR - Pressure control

The pressure controller serves to maintain a constant pressure in a hydraulic system within the range of the pump. The pump therefore supplies only the amount of hydraulic fluid required by the system. Pressure may be steplessly set at the pilot valve.

## Static characteristic

(at  $n_1 = 1500$  rpm;  $t_{oil} = 122^\circ F / 50^\circ C$ )

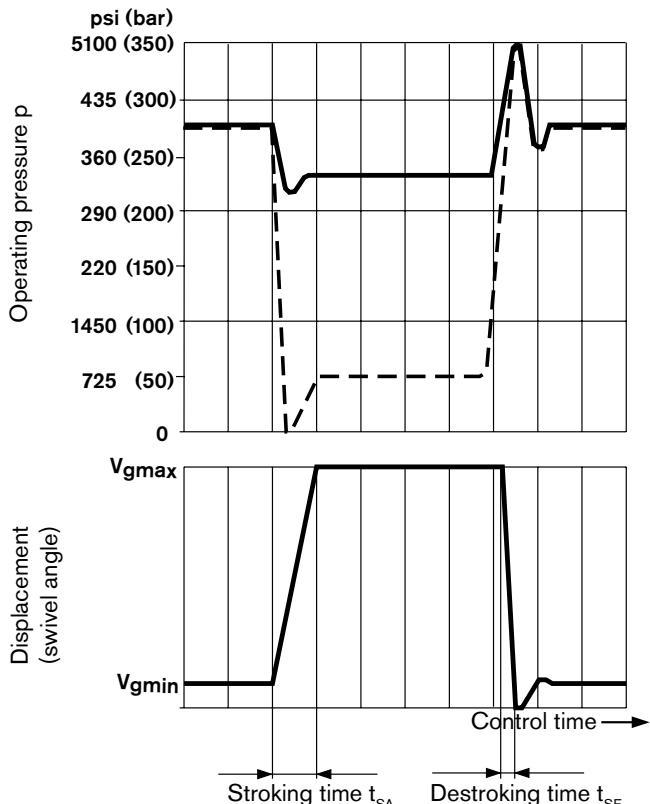

## Dynamic characteristic

The opening curves are mean values measured under test conditions with the unit mounted inside the tank.

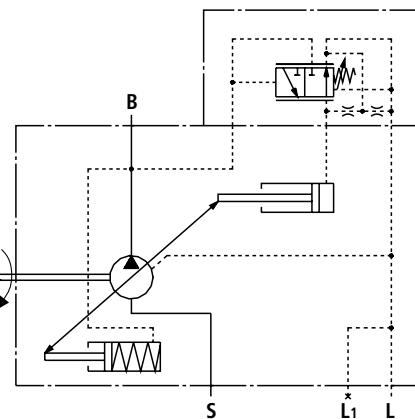

Conditions:  $n = 1500$  rpm  
 $t_{oil} = 122^\circ F (50^\circ C)$   
Main relief set at 5100 psi (350 bar)

Stepped loading by suddenly opening or closing the pressure line using a pressure relief valve at 3.3 ft (1 m) downstream from the pump pressure outlet.

# DRG - Pressure control, remote

Function and design as for DR.

A pressure relief valve may be externally piped to port X for remote control purposes. However it is not included in the scope of supply with the DRG control.

The differential pressure at the DRG control spool is set as standard to 290 psi (20 bar) and this results in a pilot flow of 0.4 gpm (1.5 L/min). If another setting is required, please state this in clear text.

We recommend that one of the following is used as the separate pressure relief valve.

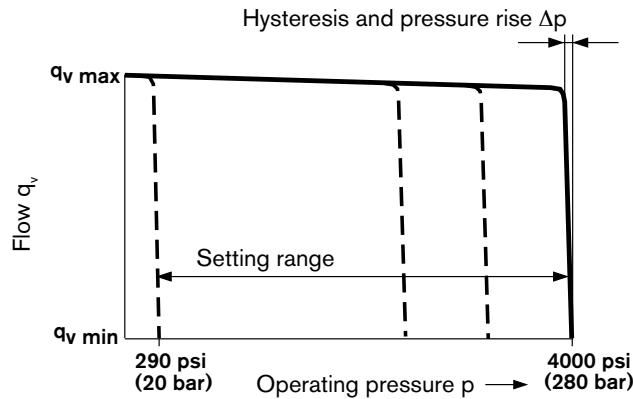

DBDH 6 (hydraulic) to RA 25402 or

DBETR-SO 381 with orifice DIA 0.0315 in (0.8 mm) in P (electric) to RA 29166.

Max. length of piping should not exceed 6.5 ft (2 m).

## Static characteristic

(at  $n_1 = 1500$  rpm;  $t_{oil} = 122^{\circ}\text{F} / 50^{\circ}\text{C}$ )

## Control data

Hysteresis  $\Delta p$  \_\_\_\_\_ max. 45 psi (3 bar)

## Pressure rise, max.

# DFR / DFR1 - Pressure flow control

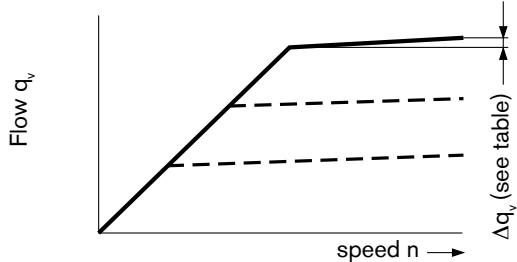

In addition to the pressure control function, the pump flow to the actuator may be varied by means of a differential pressure (e.g. over an orifice or directional control valve). The pump supplies only the amount of fluid as required by the actuator. In the DFR1-valve version the orifice between the X port and tank is plugged. For function and content of pressure control see pages 14/15.

## Static characteristic

## DFLR - Pressure / flow / power control

In order to achieve a constant drive torque with a varying operating pressure, the swivel angle and with it the output flow from the axial piston unit is varied so that the product of flow and pressure remains constant.

Flow control is possible below the limit of the power curve.

### Static characteristic

The power characteristic is set at the factory, please state your requirements in clear text e.g. 40 HP (30 kW) at 1800 rpm.

### Control data

For technical data constant pressure control see page 16.

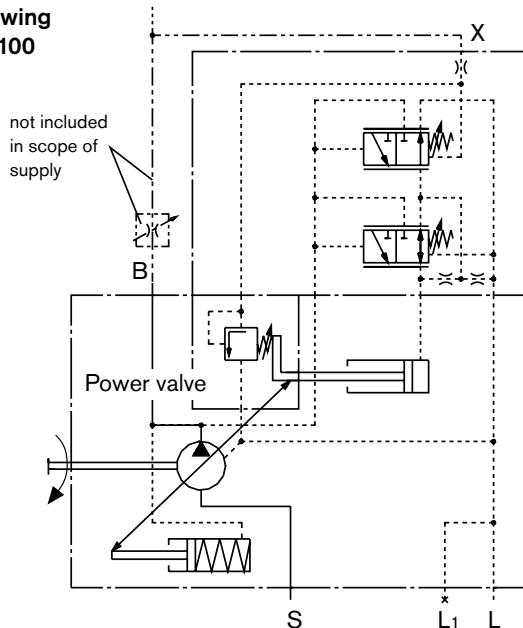

For technical data flow control see page 18.

Start of control \_\_\_\_\_ from 1160 psi (80 bar)

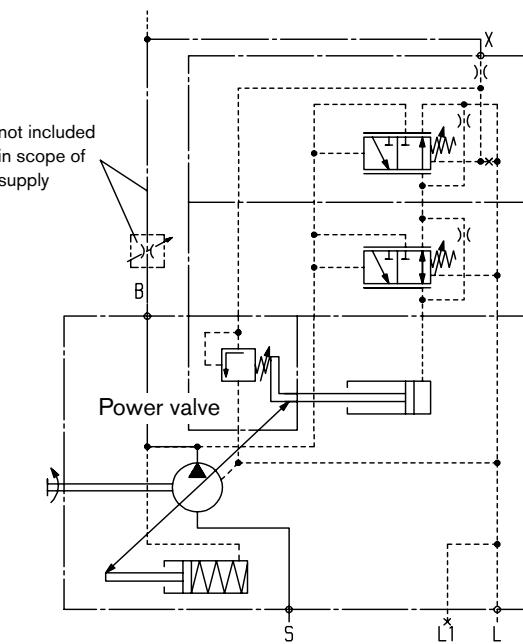

Pilot oil consumption \_\_\_\_ max. approx. 1.45 gpm (5.5 L/min)

Flow loss at  $q_{v_{max}}$  see pages 10 and 11.

## Through drives

Axial piston units A10V(S)O can be supplied with a through drive as shown in the ordering code on page 3. The type of through drive is determined by codes (K01–K24). If the combination pump is not mounted in the factory, the simple type code is sufficient.

Included in this case are: Shaft coupler, seals, and if necessary an adapter flange.

### Maximum permissible input and through drive torques

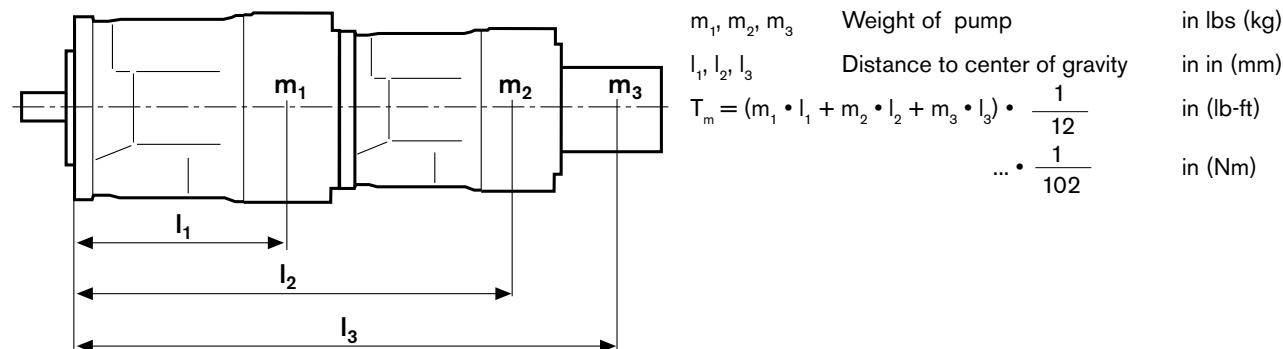

The drive torques for pump 1 and pump 2 can be split up as required. However the max. permissible input torque  $T_{tot}$  as well as the max. permissible through drive torque  $T_{thr}$  may not be exceeded.

Size	18	28	45	71	100	140
Max. perm. input torque $T_{tot}$						
With shaft K $T_{tot}$ lb-ft (Nm)	77 (104)	107 (145)	156 (212)	319 (433)	553 (750)	875 (1186)

1. If a **second Rexroth pump must be factory mounted** the two individual model codes must be combined with a "+".

Model code pump 1+ model code pump 2.

**Ordering example :**

A10VO100DR/31R-PSC12K07 + A10VO71DR/31R-PSC12N00

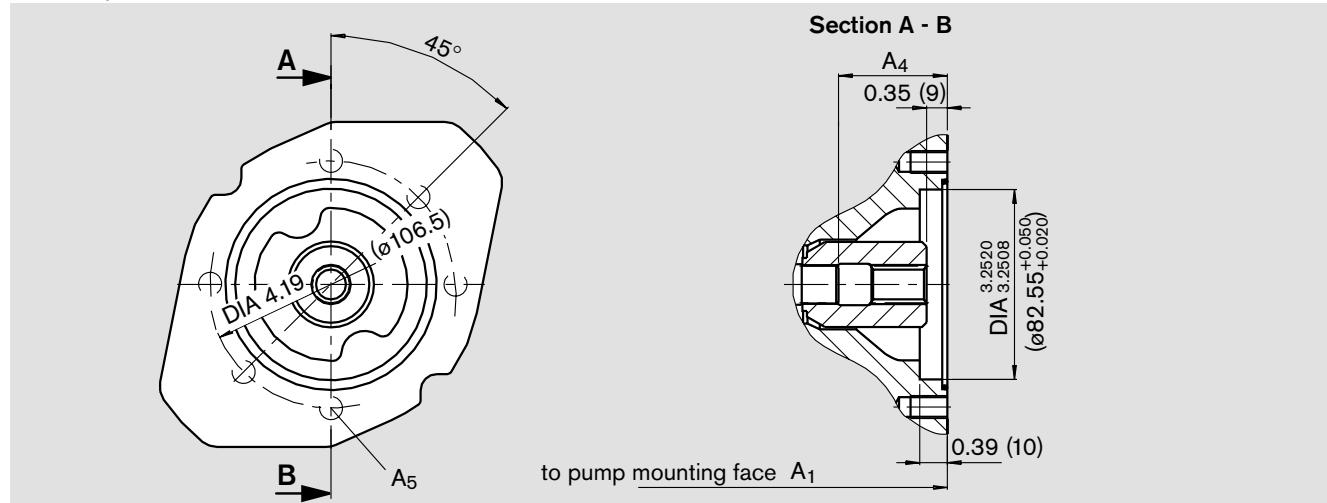

2. If a **gear pump or a radial piston pump is to be factory mounted** as a second pump please consult the factory.

## K17 Flange SAE J744 - 152-4 (D)

Hub for splined shaft to ANSI B.92.1a-1976 1 3/4 in 13T 8/16 DP<sup>1)</sup> (SAE J744 - 44-4 (D))

<sup>1)</sup>pressure angle 30°, flat root side fit, tolerance class 5

# Installation notes

Optional installation position. The pump housing must be filled with fluid during commissioning and operation.

In order to attain the lowest noise level, all connections (suction, pressure, pilot, case drain) must be linked by flexible members to tank.

Avoid placing a check valve in the case drain line. In some cases it may be permissible however. Please consult us.

The largest standard pipe connection must be installed in the uppermost (top) leakage port..

## 1. Vertical installation (shaft end upwards)

Following installation conditions must be taken into account:

### 1.1 Arrangement inside the reservoir

Before installation fill pump housing, keeping it in a horizontal position.

a) If the min. fluid level is equal to or above the pump mounting surface:

Close port "L", "L<sub>1</sub>" and "S" open; L<sub>1</sub> piped and also S with suction pipe (see fig. 1).

b) If the min. fluid level is below the pump mounting surface: pipe port "L" and "S" acc. to fig. 2. Conditions acc. to item 1.2.1, close port "L".

**Note:** In order to avoid damages at the pump, all attached parts (e.g. protective caps, covers, etc.) must be removed before installation.

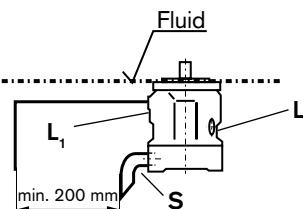

Fig. 1

### 1.2 Arrangement outside the reservoir

Before installation fill pump housing, keeping it in a horizontal position. For mounting above the tank see fig. 2.

Limiting condition:

**1.2.1** Min. pump inlet pressure  $p_{abs\ min} = 11.6 \text{ psi}$  (0.8 bar) under static and dynamic loading.

Note: Avoid mounting above tank wherever possible in order to attain a low noise level.

The permissible suction height "h" is a result of the overall pressure loss, but may not be greater than  $h_{max} = 31.5 \text{ in}/800 \text{ mm}$  (Immersion depth  $h_{t\ min} = 7.8 \text{ in}/200 \text{ mm}$ ).

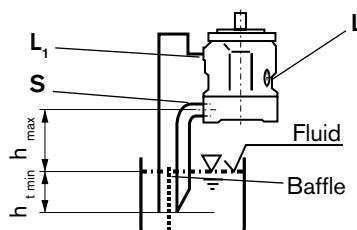

Fig. 2

Overall pressure loss

$$\Delta p_{Ges} = \Delta p_1 + \Delta p_2 + \Delta p_3 \leq (1 - p_{abs\ min}) = 3 \text{ psi} (0.2 \text{ bar})$$

$\Delta p_1$ : Pressure loss in pipe due to accelerating column of fluid

$$\Delta p_1 = \frac{\rho \cdot l \cdot dv}{dt} \cdot 10^{-5} [\text{bar}]$$

$\rho$  = density [ $\text{kg/m}^3$ ]

$l$  = pipe length [m]

$dv/dt$  = rate of change in fluid velocity [ $\text{m/s}^2$ ]

$$\Delta p_2: \text{Pressure loss due to static head}$$

$$\Delta p_2 = h \cdot \rho \cdot g \cdot 10^{-5} [\text{bar}]$$

$h$  = height [m]

$\rho$  = density [ $\text{kg/m}^3$ ]

$g$  = gravity. =  $9,81 \text{ m/s}^2$

$$\Delta p_3: \text{line losses (elbows etc.)}$$

## 2. Horizontal installation

The pump must be installed in such a manner, that either "L" or "L<sub>1</sub>" is at the top.

### 2.1 Arrangement inside the reservoir

a) If the min. fluid level is above the top of the pump:

Close "L<sub>1</sub>", "L" and "S" open, mount suction pipe to port S, and pipe "L" at least 8 in (200 mm) away from suction pipe (see fig. 3).

b) If the min. fluid level is equal to or below the top of the pump:

Pipe port "L" and "S" acc. to fig. 4, port "L<sub>1</sub>" closed. Conditions correspond with item 1.2.1.

**Note:** In order to avoid damages at the pump, all attached parts (e.g. protective caps) must be removed.

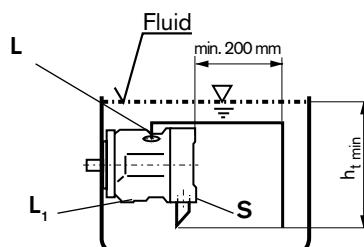

Fig. 3

### 2.2 Arrangement outside the reservoir

Fill pump housing before commissioning.

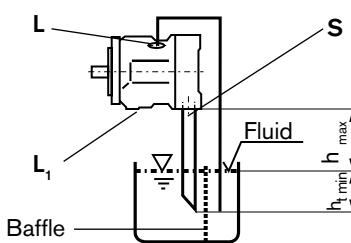

Fig. 4

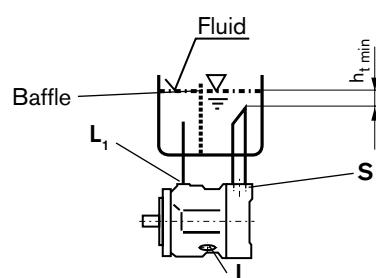

Fig. 5

## Safety information

- Pump A10V(S)O was designed for operation in open loop circuits.
- Systems design, installation and commissioning require trained technicians or tradesmen.
- All hydraulic ports can only be used for the fastening of hydraulic service lines.
- Tightening torques:  
The tightening torques mentioned in this data sheet are maximum values and must not be exceeded (max. values for thread).  
Manufacturer's information concerning the maximum permitted tightening torques of the various fittings are to be observed!  
For ISO 68 mounting bolts, we recommend that tightening torques be checked on a case by case basis in accordance with VDI 2230, published 2003.
- During and shortly after operation of a pump the housing and especially a solenoid can be extremely hot, avoid being burned!
